INTERLEAVINGS ON CATEGORIES
WITH LAX $[0, \infty)$ -ACTION

Thursday, March 23, 2017

1:15 p.m. in ES-143

ABSTRACT. The interleaving distance is a powerful tool in TDA which has been shown to provide a metric for such topological signatures as persistence diagrams and Reeb graphs. In this talk we generalize the idea of interleavings to a broader class of objects, namely categories with lax $[0, \infty)$ -action. This allows us to show that many commonly used distances, such as the L_∞ -distance and the Hausdorff metric, are in fact special cases of interleaving distances. In addition, there is a natural way to define morphisms between these categories that generalizes the stability results of TDA to a broad class of objects by showing that the morphisms are 1-Lipschitz.
