DYNAMICAL SYSTEMS ON CHAIN COMPLEXES PART 1

Thursday, November 14, 2019

1:15 p.m. in ES-143

ABSTRACT. In the first talk of this series of two talks, we will discuss how to introduce a notion of *vector field* and its (discrete time) *flow* on any chain complex. The resulting dynamical systems theory allows to replace the chain complex with a “smaller” one of the same homotopy type. In many cases of interest this can be accomplished in an explicit, canonical, and symmetry-preserving manner. In the second talk we will discuss how this theory can be used to construct minimal free resolutions of monomial ideals and of toric rings, thus providing a solution to two long-standing open problems in commutative algebra.
